

```
Using inheritance, one class can acquire the properties of others. Consider the following Animal class:
   class Animal{
        void walk(){
              System.out.println("I am walking");
   }
This class has only one method, walk. Next, we want to create a Bird class that also has a fly method. We do this using
extends keyword:
   class Bird extends Animal {
        void fly() {
              System.out.println("I am flying");
   }
Finally, we can create a Bird object that can both fly and walk.
   public class Solution(
       public static void main(String[] args){
           Bird bird = new Bird();
           bird.walk();
           bird.fly();
       }
   }
The above code will print:
   I am walking
   I am flying
This means that a Bird object has all the properties that an Animal object has, as well as some additional unique properties.
The code above is provided for you in your editor. You must add a sing method to the Bird class, then modify the main
method accordingly so that the code prints the following lines:
   I am walking
   I am flying
   I am singing
```

```
18
           void sing(){
                System.out.println("I am singing");
 19
 20
 21
       }
 22
 23
      public class Solution{--
                                                                           Line: 12 Col: 1
                                                                                 Submit Code
                                                                    Run Code
\hat{\bot} Upload Code as File
                       Test against custom input
 Congratulations
                                                                             Next Challenge
